## TGS 2611-E00 - for the detection of Methane

### Features:

- \* High selectivity to methane
- \* Low power consumption
- \* Long life and low cost
- \* Uses simple electrical circuit

### Applications:

- \* Domestic gas alarms
- \* Portable gas detectors
- \* Gas leak detector for gas appliances

**TGS2611-E00** is a semiconductor type gas sensor which combines very high sensitivity to methane gas with low power consumption and long life. Due to miniaturization of its sensing chip, TGS2611-E00 requires a heater current of only 56mA and the device is housed in a standard TO-5 package.

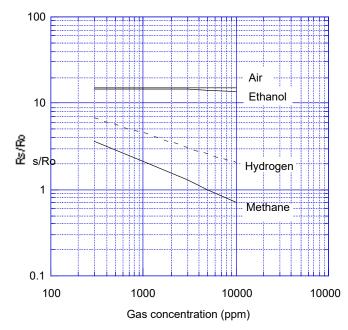

TGS2611-E00 uses filter material in its housing which eliminates the influence of interference gases such as alcohol, resulting in highly selective response to methane gas. This feature makes the sensor ideal for residential gas leakage detectors which require durability and resistance against interference gas.

The TGS2611-E00 is able to satisfy the requirements of performance standards such as UL1484 and EN50194.

The figure below represents typical sensitivity characteristics, all data having been gathered at standard test conditions (see reverse side of this sheet). The Y-axis indicates sensor resistance ratio (Rs/Ro) which is defined as follows:

Rs = Sensor resistance at various concentrations Ro = Sensor resistance in 5000ppm of methane

#### Sensitivity Characteristics:

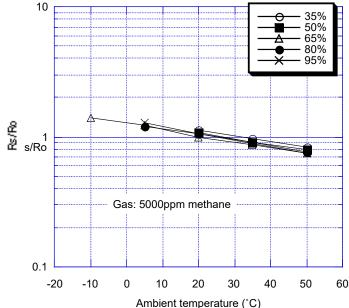

The figure below represents typical temperature and humidity dependency characteristics. The Y-axis indicates sensor resistence ratio (Rs/Ro), defined as follows:

Rs = Sensor resistance in 5000ppm of methane at various temp/humidities

Ro = Sensor resistance in 5000ppm of methane at 20°C/65%RH

#### Temperature and Humidity Dependency:

#### **PRODUCT INFORMATION**

### FIGARO

#### **Basic Measuring Circuit:**

The sensor requires two voltage inputs: heater voltage (V<sub>H</sub>) and circuit voltage (V<sub>C</sub>). The heater voltage (V<sub>H</sub>) is applied to the integrated heater in order to maintain the sensing element at a specific temperature which is optimal for sensing. Circuit voltage (V<sub>C</sub>) is applied to allow measurement of voltage VOUT(V<sub>RL</sub>) across a load resistor (R<sub>L</sub>) which is connected in series with the sensor.

A common power supply circuit can be used for both V<sub>C</sub> and V<sub>H</sub> to fulfill the sensor's electrical requirements. The value of the load resistor (R<sub>L</sub>) should be chosen to optimize the alarm threshold value, keeping power dissipation (Ps) of the semiconductor below a limit of 15mW. Power dissipation (Ps) will be highest when the value of Rs is equal to R<sub>L</sub> on exposure to gas.

The value of power dissipation (Ps) can be calculated by utilizing the following formula:

$$P_{s} = \frac{(V_{c} - V_{RL})^{2}}{R_{s}}$$

For information on warranty, please refer to

Standard Terms and Conditions of Sale of Figaro

USA Inc. All sensor characteristics shown in

this brochure represent typical characteristics.

Actual characteristics vary from sensor to

sensor. The only characteristics warranted are

those in the Specification table above.

Sensor resistance (Rs) is calculated with a measured value of Vout(  $V_{RL}$ ) by using the following formula:

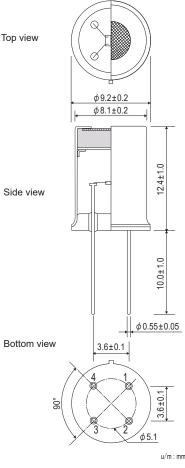

$$Rs = (\frac{Vc}{VRL} - 1) \times RL$$
